While it is welcomed that Photoshop has adopted the 64-bit architecture, it still feels slow. I like the new features they've added with the Spot Removal tool, and being able to manually refine your correction in a separate layer reduces the chances of mistakes. The one thing I don't like is the total lack of way to truly export in a Compact Flash format. Files that use one gigabyte of memory are now around five gigabytes. The Graduated Filter dialog is smarter now than the older version, even though the majority of the gridlines are useless if you don't set them to snap to the gridlines. And you can now be connected to a multi-window screen with the inspector active in one window and Photoshop running in the other. The new photo annotations feature allows you to import and edit your images yourself and still mark them with a different icon attached to the image. It has some great new features, but I was hoping it would have a budget-oriented release. Some of the other Photoshop application window options are quite helpful. The long delay when you right click and there's no menu and no file system buttons is still present, and it's frustrating. Photoshop is still a complex application, but with all of its toolkit window features, it's not as hard to figure out as it once was. The downside to the new CC is the updated resolution. While there's no problem getting your old 333 dpi files opened and easily modified, the new 37 million pixels per inch makes it harder than ever before to do so. Regardless, Photoshop will still allow you to save an 1800 dpi file at any size while keeping the higher resolution file as a reference. The new file resolution effectively negates the benefits of the new cropping tool. The latest Photoshop also apparently struggles with the latest technology, and doesn't appear to play well with the newer, more powerful CPUs like the Intel i7 CPU.
